

ME 3001 Lecture - A Brief Refresher in MATLAB

- **What is it?**

- High Level programming language
 - * language written in C++
 - * Interactive Development Environment written in JAVA
 - * Windows, Mac, and Linux compatible
- *MATrix LABoratory*
- *Technical Computing Language* - Mathworks

- **Why use it?**

- A powerful tool for engineers, scientists, and students
 - * optimized for floating point arithmetic and linear algebra
 - * extensive library of mathematical functions and operations
 - * specialized functions and operations
 - Aerospace
 - Robotics
 - Communications
 - Image/Signal Processing
 - Embedded Systems and Controls
 - * ability to use *symbolic programming*
- Ease of Access and Community
 - * *Plug and Play*, it works out of the box
 - * requires little or no programming experience to begin
 - * online community for sharing code, *MATLAB Central*

- **Why Not?**

- **Review of some basic MATLAB**

- **Useful Commands(type in Command Window)**

```
>> clear variables
```

```
>> clc
```

```
>> close all
```

```
>>
```

- **Built-In MATLAB functions**

- * **Typical Mathematics Functions**

- `sqrt()`

- `exp()`

- `log()`

- `log2()`

- `log10()`

*** Other Useful Functions**

- `round()`
- `floor()`
- `int8()`
- `sign()`
- `mod()`
- `rem()`
- `fzero()`

*** The Built in Help**

- `>> help fzero()`
- use the help to get information about the built in functions
- the full documentation is also available online

– Constants

Several useful constants are built into MATLAB.

- * `pi`

- * `i`

- * `j`

- * `inf`

- * `NaN`

– Random Numbers

Sometime it is useful generate random data in MATLAB.

- * `rand()`

- * `randi()`

– User Defined Functions

- * We often write our own functions in MATLAB. To do this we must define the function in the function file.

- * When we use a function we *call* the function.

- * we can refer to a function with *handle operator*

• A Mechanical Design Problem

As an engineer you are asked to design a structure. The geometry of this structures is simple but certain properties are critical. Also you want to spend as little as possible on materials.

surface area, $s = \pi r l = \pi r \sqrt{h^2 + r^2}$

volume, $v = \pi r^2 \frac{h}{3}$

The first structure you are required to design is a cone with a surface area of exactly $25m^2$ to a tolerance of $0.1 m^2$ and a height of exactly $1m$. Your goal is to find the radius in meters.

Write a program the uses the *Newton -Raphson* method to solve the problem. Verify and compare your answer with the *fzero* function.

- **REMINDER - Homework 1 is due Friday**
- **REMINDER - MATLAB script from today's lecture will be posted on ilearn.**
