What is a Differential Equation?
Standard Form of an ODE

What is a Differential Equation?

Definition:

A **differential equation** is an equation which describes a function

and one or more of its _____ of the

_____ _____

with respect to the _____.

Definitions
Classification
Engineering Applications
Example

What is a Differential Equation?
Standard Form of an ODE

Standard Form of an ODE

Ordinary Differential Equations are written in the following form.

$$a_n \frac{dy^{(n)}}{d^{(n)}x} + a_{n-1} \frac{dy^{(n-1)}}{d^{(n-1)}x} + ... + a_2 \frac{dy^2}{d^2x} + a_1 \frac{dy}{dx} + a_0 y = f(x)$$

The apostrophe is commonly used for the derivative.

$$a_n y^{(n)} + a_{n-1} y^{(n-1)} + ... + a_2 y'' + a_1 y' + a_0 y = f(x)$$

If time is the independent variable the equation changes slightly.

Is the differential equation ordinary or partial?

An **ordinary** differential equation has _____ independent

variable and _____ dependent variable.

A **partial** differential equation has _____

independent variable _____ dependent variable.

What is the order of the equation?

The **order** of a differential equation is the

_____ _____

present in the equation.

What is the degree of the equation?

The **degree** of a differential equation is the _____

of its highest derivative, after the equation has been made rational

and integral in all of its derivatives.

Is the differential equation linear or non-linear?

An ordinary differential equation is _____ if the following statements are true.

1. *The dependent variable and its derivatives are of the first degree.*

2. *The coefficients are constants or dependent on the independent variable.*

If either rule is broken, the equation is _____-_____.

Engineering Applications

Differential equations are used to describe physical systems in many areas of engineering. An equation that represents a physical (or theoretical) system is known as a _____

_____.

- Solid Mechanics

- Kinematics and Dynamics

- Heat Transfer and Thermodynamics

- Fluid Mechanics

Example - Mathematical Model
Example - Solution

Example - Mathematical Model

Newton's Second Law

$\Sigma F = m a$

leads to an *equation of motion*.

$\dot{y} + \frac{c}{m} y = f(t)$

Example - Solution
Example - Solution

The **solution** to a differential equation describes the

_____ _____ as a function

of the _____ _____.
There are many different methods for finding the solution.
